TITLE: Analysis of the propulsive qualities of some specific schemes of ideal jet engines

SOURCE: AN SSSR. Institut dvigateley. Trudy, no. 6, 1962, 170-176

TOPIC TAGS: jet, propulsion, rocket, air-breathing, air jet, hydrojet, engine, primary, secondary, efficiency, propulsive.

ABSTRACT: This theoretical paper derives and analyzes equations that are suitable for the evaluation of the propulsive efficiency of jet engines with the consideration of arbitrary (including small) relative flow rates of the surrounding medium entrained in the jet flow, and also for various flow velocities of the surrounding medium and of the ejected working fluid carried aboard. The especial field of application of this study is for motion in water. An analysis of the elementary efficiency equations shows that, with an increased relative secondary-flow rate (of the entrained surrounding medium), at a constant ratio between the speed of motion and the speed of the primary, the propulsive efficiency decreases. The seeming inconsistency of this statement with the observation that in actual

Card 1/2

L 18849-63

ACCESSION NR: AT3001869

engines every effort is made to increase the mass-flow rate of the secondary (surrounding-medium) fluid passing through the engine in the interest of an improved efficiency, is resolved by the comment that in real and thermodynamic processes an increase in the relative mass flow of the surrounding medium results in a decrease in the speed of ejection of the mixed jet and therefore an increase of the ratio of speed of motion divided by the speed of ejection. The dependence of the propulsive efficiency on the relative mass flow, (from the rocket regime (relative mass flow zero) to full entrainment (relative mass flow infinity)), is analyzed and pictured. This analysis is performed for an ejection-speed ratio (primary flow/secondary flow) both equal to unity and at variance with unity. Orig. art. has 8 figures.

B

TITLE: Generalized hydrodynamic equation for determining the thrust of an isolated
direct-reaction motorSOURCE: AN SSSR. Sibirskoye otdeleniye. Seriya tekhnicheskikh nauk, no. 2, 1966,
3-11TOPIC TAGS: rocket engine, air breathing engine, pulsejet engine, thrust, plasma
engine

ABSTRACT: The thrust of various new types of reaction motors cannot always be calculated by the theory developed by Zhukovskiy (K teorii sudov, privodimykh v dvizheniye siloy reaktsii vytékayushchey vody.- Tp. TsAGI, vyp. 112, M., 1932), and B. S. Stechkin (Teoriya vozdušnogo reaktivnogo dvigatelya.-Tekhnika vozdušnogo flota, 1929, No. 1). Therefore, in the present study the following generalized equation is presented which permits evaluation of axial thrust component R_x :

Card 1/5

UDC: 621,45,455

L 02973-67

ACC NR: AP6032929

$$R_x = \iint_{S_4 - S_1} (p_1 - \rho v_n^2) \cos(\hat{n} \cdot \vec{x}) dS + \iint_{S_1 - S_2} (p_1 + \rho v_n^2) \cos(\hat{n} \cdot \vec{x}) dS + \\ + \iint_{S_2 - S_3} [p_1 \cos(\hat{n} \cdot \vec{x}) + v \cos(\hat{v} \cdot \vec{x})] dS - \iiint_V \frac{\partial}{\partial t} (\rho v_x) dV.$$

Here, dS is the area element; dV , volume element; v_n , velocity normal to the control surface; v_x , velocity in direction x ; \hat{n} , unit vector normal to the contour; \hat{v} , unit vector tangential to contour; and $p_1 = p - p_0$ (p_0 = pressure in medium, p_1 = excess pressure). Application of the formula to a rocket without induction of the external pressure yielded the usual formula $R = G/g \cdot v_4$ (v_4 = exhaust velocity). For a rocket using an internal as well as an inducted medium; $R = G/g (v_4 - v_1)$ (v_1 = flight speed). $G' = G^I + G^{II}$, where G^I is the mass flow rate of the internal medium and G^{II} , the mass flow rate of the external medium. For a pulsating engine using both the internal and external fluids, the following formula for the mean thrust was obtained:

$$R = \frac{1}{t_C} \left\{ \int_0^{t_1} \left[\rho_m F_{x_r} \frac{dv_m}{dt} + \frac{G'}{g} v_4 - \frac{G''}{g} v_1 + (p_1 - p_0) F - \right. \right. \\ \left. \left. - (p_1 - p_0) S_{1 - 1'} \right] dt + \int_{t_1}^{t_C} \left[\rho_m F(l - x_r) \frac{dv_m}{dt} + \frac{G''}{g} v_1 + (p_1 - p_0) F \right] dt \right\}.$$

TITLE: Testing of highly refractory insulation materials in lithium vapors at high temperatures in a vacuum

SOURCE: Ogneupory*, no. 2, 1964, 82-89

TOPIC TAGS: insulation, insulation material, insulation material testing, lithium vapor, refractory insulation material, high temperature material testing, insulation material alkali metal resistance

ABSTRACT: In respect to the effect of alkali metals on refractory materials at high temperatures, tests have been conducted on the resistance of different materials to liquid lithium and ionized lithium vapors in a vacuum. Aluminum oxide, calcium oxide, magnesium oxide (pure and with Al_2O_3 admixtures), zirconium dioxide and certain other high-melting materials (zircon, calcium zirconate, silicon nitride, silicon carbide on a vitreous bond, silicon carbide on β -carborundum and silicon nitride bonds, as well as a material with a boron nitride base) served as base materials. Samples of corundum, zirconium dioxide, magnesium oxide, and cal-

Card 1/3

ACCESSION NR: AP4013187

cium oxide were prepared using G-0 technical alumina (98.7% Al_2O_3), white electrosmelted corundum No. 36 and 280 (95.5% Al_2O_3), smelted technical ZrO_2 , stabilized by calcium oxide (91.16% ZrO_2 , 6.49% CaO), monoclinic ZrO_2 (98.02% ZrO_2), technical magnesium oxide (98.7% MgO), and calcium carbonate. Samples were prepared in solid-sintered and granular-porous pieces. The basic results were: (1) corundum, zirconium dioxide, zircon, calcium zirconate, and silicon nitride were affected considerably by lithium, particularly in contact with melted lithium; (2) magnesium oxide and calcium oxide showed greater chemical stability; (3) the chemical stability of magnesium oxide with Al_2O_3 admixtures was noticeably less than that of pure magnesium oxide; (4) the carbocorundum samples on a bond of β -carborundum did not possess the required electroinsulating properties; (5) boron nitride-base samples showed chemical and thermal stability. It was concluded that refractory materials of pure aluminum oxide and pure zirconium dioxide, zircon, calcium zirconate and silicon nitride are not serviceable because of their low chemical stability; however, boron nitride, calcium oxide, and magnesium oxide may be used as insulators. Orig. art. has: 8 figures, 2 tables.

TITLE: Certain peculiarities of the calculation of the nonequilibrated two-phase jet

SOURCE: AN SSSR. Sibirskoye otdeleniye. Izvestiya. Seriya tekhnicheskikh nauk,
no. 2, 1965, 88-93

TOPIC TAGS: air flow, gas jet, flow analysis, flow velocity, subsonic flow, flow density

ABSTRACT: Earlier investigations of the acceleration and deceleration of droplets in gas flows did not take into account the mechanical interactions between the gas and the droplets. The present study investigates a flow of gas and droplet the temperatures and velocities of which are essentially different. The mechanical and thermal interactions are taken into account and the equations of motion of the particles are presented in the form of an empiric quadratic law incorporating the pressure gradient. In addition to the usual assumptions that the probability of splitting and collision of particles is negligibly small, that the size of all

L 3830-66

ACCESSION NR: AP5021076

particles is equal to the mean statistical (over the weight) diameter of the droplets, and that the mechanical gas-droplet interaction resembles an elastic collision with a nonsubstantial energy dissipation, the present authors assume that 1) the flow lines are smooth; 2) the length of the channel is much greater than its cross section; 3) the unidimensional approximation can be applied; 4) there are no chemical or phase transitions present; 5) the droplet density, their size, and the gas parameters are described by the inequality

$$2d_k \cdot l \ll L,$$

(where d_k is the mean statistical (over the weight) droplet diameter; l is the mean statistical distance between the droplets; L is the linear dimension of the entire flow), 6) the droplet temperature may be assumed uniform because of the large thermal conductivity of the fluid, and 7) the gas viscosity relative to the droplets is small. The calculational approach is illustrated by numerical calculations on an electronic computer of the isochoric process for the case of water droplets within the vapor. Results point to the wide range of the possible values of the characteristics of the gas-dynamic process as function of various flow conditions even prior to the start of phase transitions. Orig. art. has: 39 formulas and 4 figures.

TITLE: Effect of a burner on the characteristics of a gas-turbine combustor

SOURCE: Energomashinostroyeniye, no. 9, 1964, 12-15

TOPIC TAGS: combustor, combustor test, combustion chamber, combustion chamber test, gas turbine/GT-25-700-1-LMZ gas turbine plant

ABSTRACT: A continuation of the authors' earlier experiments (Energomashinostroyeniye, 1962, no. 10) is reported. The possibility of a radical improvement in a premixing register burner by modifying its design was explored. The principal experiments were conducted at an air pressure of 1.5 atm, a temperature before the chamber of 300°C, an air flow of 7-8 m³/sec, and an air-fuel ratio of 4.5-20 (primary-air ratio 1-5). Several types of

Card 1/3

ACCESSION NR: AP4045906

burners were tested; four of them are shown in Enclosure 1. The flow aerodynamics was investigated with a cold blowdown of the chamber. Register burner I was found to produce the highest temperature field in the flame tube. The best operating conditions of the flame tube were observed (at 700C of exhaust gases) with nonregister-type diffusion burners. The intensity and completeness of combustion were also investigated (curves supplied), as well as combustion stability, pressure loss in the chamber, and the temperature field of exhaust gases. TITLE: Investigation of the heat transfer characteristics of a water-cooled combustion chamber

SOURCE: Ref. zh. Mekhanika, Abs. 5B312

REF SOURCE: Vestn. Kiyevsk. politekhn. in-ta. Ser. teploenerg., no. 2, 1965, 20-25

TOPIC TAGS: combustion chamber, heat transfer coefficient, flame tube, Reynolds number

ABSTRACT: The heat transfer characteristics of one section of a flame tube mounted in a large-scale model of a combustion chamber were considered. A regenerator was located after the combustion chamber. This permitted experiments with heated (to 300C), clean air. Each combustion chamber element had an individual air supply and was equipped with a regulating and a measuring system. The experiments were conducted at an essentially constant pressure of ≈ 1.25 bar, while changing the air temperature from 75--300C, the coefficient of excess air in the combustion zone from 1.1--8.0, and the exhaust velocity from the burner from 20--80 m/sec. The heat emission coefficient on the heating surface was determined in each experiment and was assumed to be approximately equal to the coefficient of heat transfer. The

Card 1/2

ACC NR: AR6028072

temperature distribution along the length of the combustion chamber was not investigated in detail. As can be seen from the graphs, the temperature of the wall layer in the investigated burner-flame tube section system depends on the degree of preheat and can reach 950--1050°C. The Stanton criterion $S = \alpha/(W\rho c_p)$ was used as the determining heat transfer criterion in evaluating the experimental results. The results are represented adequately by the equation

$$S = \frac{1}{1 + 0.0136 R^{0.53} (0.120/\theta_{cr})^{0.67}}$$

where $\theta_1 = T_1/T_0$ - relative temperature of the burning mixture; $\theta_{cr} = T_{cr}/T_0$ - relative wall temperature; R - Reynolds number. This equation can be used to evaluate the heat exchange in water-cooled combustion chambers in which no cooling fluid is introduced into the wall layers of the flame tube. Bibliography of 3 titles. TITLE: Photocolorimetric Determination of the Small Copper Quadrant by Means of 2,2' Dichinolil (Fotokolorimetricheskoye opredeleniye malykh kolichestv medi s pomoshch'yu 2,2' -dikhinolila)

PERIODICAL: Zavodskaya Laboratoriya, 1957, Vol. 23, Nr 7, pp. 787-788 (USSR)

ABSTRACT: Dichinolil as a reagent is obtained by a catalytic dehydro-condensation of chinolin; it is then synthetized according to the method of Smirov. Dichinolil is soluble only in isoamilspirit whereby its reaction upon copper extract is increased with the solution of dichinol in isoamilspirit. Thus the content of copper in synthetic solutions, alloys and steel can be determined by its extraction. Some of the results are shown in table 1-2. Very small amounts of copper were detected in zinc, aluminum, magnesium and other metals by adding tartaric acid. The results show that a miscalculation of the copper content can only be less than 2 %.

TITLE: The laminar boundary layer on ellipsoids of revolution

SOURCE: AN SSSR. Izvestiya. Mekhanika zhidkosti i gaza, no. 6, 1966, 152-156

TOPIC TAGS: laminar boundary layer, ideal gas, compressible gas, critical point, enthalpy, Prandtl number, friction, temperature coefficient

ABSTRACT: This paper gives the results from a theoretical study of the laminar boundary layer on ellipsoids of revolution overflowed by a supersonic stream of ideal gas at a zero angle of attack. A wide range of characteristic parameters is used: $M_\infty = 3-10$, $\delta = b/a = 0.5-4$, and $H_{lw} = 0.05-0.75$. The flow of a compressible gas in a laminar axisymmetric boundary layer is described by the system

$$\frac{\partial}{\partial x}(\rho ru) + \frac{\partial}{\partial y}(\rho rv) = 0$$

$$\rho u \frac{\partial u}{\partial x} + \rho v \frac{\partial u}{\partial y} = \rho_e u_e \frac{du_e}{dx} + \frac{\partial}{\partial y} \left(\mu \frac{\partial u}{\partial y} \right)$$

Card 1/3

ACC NR: AP7001587

$$\rho u \frac{\partial H}{\partial x} + \rho v \frac{\partial H}{\partial y} + \frac{\partial}{\partial y} \left\{ \frac{\mu}{P} \left[\frac{\partial H}{\partial y} + (P - 1) \frac{\partial u}{\partial y} \right] \right\},$$

where x and y are physical coordinates directed along and normal to the generatrix of the body; r is the cross-sectional radius of the axisymmetric body; u and v are components of the velocity vector and are parallel to the coordinate axes x and y , respectively; μ is the dynamic viscosity coefficient; ρ is the density of the gas; H is the total enthalpy of the gas; and P is the Prandtl number. The subscript e refers to the external limit of the boundary layer; w , to the surface of the body. Generalized parabolic coordinates are introduced for the solution. The effect of various parameters on the nature of the variation in the friction stress along the generatrix is shown in the form

$$c_1 = \frac{r_w}{\sqrt{\frac{\mu}{\rho P_e}}} \sqrt{R_e}$$

(see Fig. 1). It is found that when the coefficient of ellipticity $\delta < 2.0$, the maximum of the local heat flux occurs in the vicinity of the leading critical point; when $\delta \geq 2.0$, it is shifted downstream from the critical point.

Title : On the Nature of Potato Degeneration

Orig Pub : Kartofel', 1958, No 1, 25-29

Abstract : The author calls viral diseases, potato degeneration, and the forms of its manifestation - degenerative diseases. In the author's opinion, viruses are protein + nucleic acid. The synthesis of any protein is determined by the composition and structure of the nucleic acids. In order to set the uniting of normal proteins in the direction of viral ones, it is necessary to change the nucleic acid specific to them. Nucleic acids differ among themselves by different combinations and proportions of nucleotides. Nucleic acids of the virus and plasma of the plant can

TITLE: Spectrophotometric Determination of Iron in Heat-resistant Alloys on Nickel Basis With the Aid of Nitroso R-salt

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Khimiya i kimicheskaya tekhnologiya, 1960, Vol. 3, No. 5, pp. 815 - 818

TEXT: The possibility of using nitroso R-salt for the determination of iron in the presence of the metal ions nickel, chromium, molybdenum, tungsten, vanadium, titanium, and cobalt, without the application of special reducing agents, was studied in this paper. The spectrometer of the type (Ф-4 (SF-4) was used. Nitroso R-salt was prepared by a known method (Ref.5). Optical densities of a number of solutions with a 5.2 pH with variable iron concentration in the presence of a 20-fold nitroso R-salt excess were investigated in order to check Beer's law. The medium was prepared by means of acetate buffer. Fig.1 shows a satisfactory fulfillment of the law. From the absorption curves (Fig.2) for nitroso R-salt and its complexes with iron- and nickel ions it results that nitroso R-salt

does not absorb in the red spectral range. The absorption curve for the complex compound shows a maximum at $\lambda = 720 \text{ m}\mu$ with $f = 18250$. The effect of foreign ions on the optical density of solutions (at $\lambda = 720 \text{ m}\mu$) containing the iron complex with nitroso R-salt was studied (Table 1). It was ascertained that the strongest effect is exerted by nickel, the main component of the alloys. It forms complex compounds with nitroso R-salt. Experiments showed, however, that when increasing the nitro R-salt excess to the 100-fold, nickel does not hamper the determination of iron, even at a ratio of 80 : 1. The disturbance by chromium ions only becomes apparent at $\text{Cr} : \text{Fe} > 6 : 1$, and by molybdenum ions at $\text{Mo} : \text{Fe} > 12 : 1$. A certain effect is also exerted by tungstate- and vanadate ions. Tantalum- and niobium ions do not react with nitroso R-salt, do not absorb, and should not disturb the iron determination. The admissible Me : Fe ratio was determined on the basis of measurements of optical densities at $\lambda = 720 \text{ m}\mu$. It is also valid for operation in the wavelength range of 620 - 780 $\text{m}\mu$, i.e., it may be considered when using photocolorimeters with sulfur-silver elements. Three samples of alloys on nickel basis with different iron

"Work of Hydroelectric plants under changing loads."

Dissertation for Candidate of Technical Sciences, Azerbaydzhani Institute, Baku (API)

Subject: Hydropower Engineering

Gidrotekhnicheskoye, Stroitel'stvo, 12, 1946

USSR/Engineering - Hydroelectric

Power

Operational Theo:

"Calculating Operational Irregularities
Hydroelectric Aggregate," A. A. Bas
Tech Sci, 4 pp

"Gidrotekh Stroi" No 10

Proposes simplified method for calculating operational irregularity of hydroelectric unit. Method is based on graphical function of dependence of power consumption and inertia of rotating mass

USSR/Engineering - Hydroelectric

Power (Contd)

claimed by Bashkirov (7-8%) is confirmed, editors will recommend method for inclusion five graphs.

Editor: None

Tech. Ed.: None

Ed.-in-Chief: None

Appraiser: None

Text Data

Coverage: A textbook on designing and operating hydroelectric plants with water piping systems. Pt. I: Basic theories of Hydraulic impact in pipes, with practical formulas for determining the velocity of wave propagation of hydraulic impact. Graphical method of computation
(Dr. M. A. Mostkov). Charts. (A. A. Bashkiroff, B. E. Sc.).

Purpose: A textbook for engineers and students engaged in problems of hydraulic impact in piping.

Facilities: None

No. Russian and Slavic References: 23
